Discussion Points

What does application security mean in an agile and continuous environment?

What does infrastructure security mean in an agile and continuous environment?

How do security teams change how they work with development teams?

How does larger scale affect securing applications/services?

How does larger scale affect security infrastructure?

How does moving to the cloud affect securing production environments?

Bonus Discussion Questions

How often do you say 'no' over security concerns?

How often do you want to?

What are companies / the security industry / vendors doing wrong these days?

What should companies / the security industry / vendors be doing that they're not?

Are there challenges to using traditional security products in your environments?

What kind of rigs are you jumping these days?
